Strong implementation. Make the proof unmistakable.

SwarmPay is a credible agentic-commerce prototype with a clear demonstration advantage: an agent can request a payment, be held before delivery, and see the same approved transaction become payable after verified evidence. Its strongest asset is the connection between AI planning and PayPal payment controls.

Innovation	Uniqueness	Positioning advantage
Strong application of existing primitives; the combination is more interesting than any single component.	A specific, demonstrable workflow. A global "first" or durable technology moat is not established.	Own payment control for agent-planned events: one budget, separate merchant terms, visible evidence.

Submission status: material blockers remain

The repository is private as of this review. The supplied submission materials still lack a finished public video link and contain live-verification placeholders. The live site passed anonymous health checks. [S1-S3, R1-R3]

Deadline: November 12, 2026 at 21:00 Stockholm time (20:00 UTC / 12:00 PST). Target submission on November 11. The recommendations below are review judgments, not predictions of judges' scores.

01 / ASSESSMENT

Where the entry is strongest

The five official criteria are equally weighted. Engineering depth helps, but an incomplete presentation or vague audience has the same scoring weight as implementation. [S2]

Criterion	Assessment	What the available evidence supports
Technological implementation	Strong	Two seller approvals, immediate capture for tents, authorization then capture for catering, receipt verification, request identities and reconciliation. AI selects bounded offer IDs; code checks the result. Prior sandbox evidence is meaningful, but not a fresh checkout test. [R1, R3-R5]
Design	Promising; provisional	An event-first landing, one next action, schedule, ledger and explainable holds form a coherent product. Source-defined small text needs stronger contrast. This review could not inspect the live rendered interface. [R4]
Potential impact	Evidence gap	The event-organizer problem is specific. No customer interviews, pilot usage, willingness-to-pay results or measured time savings were found in the supplied materials. Merchant acceptance of delayed payment also needs evidence. [R2]
Innovation / idea	Distinctive combination	The valuable sequence is approved plan → request held → signed delivery → permitted capture, across two merchants. Agent APIs, spending limits and signed authorization are established concepts. [S4-S6]
Presentation	Incomplete in materials	A detailed script and historical results exist. The README and submission draft still have video placeholders, and the current script spans too many sponsor features for a clean first viewing. [R1, R2, R6]

Best award fit

Prioritize Best Use of Agentic Commerce, then Best Use of PayPal + AI. AG Grid is the strongest sponsor story because the dashboard and custom analyst help explain actual payment state. Best Demo Delivery becomes a plausible target only after the final video is clear and complete. This is fit assessment, not a win forecast. [S1, R2]

For Most Creative, show the unexpected behavior: the system holds the agent's request, then permits payment when the agreed evidence exists. "AI plus payments" alone will not distinguish the entry.

02 / GAP REPORT

Close these before submission

P0 = entry readiness or the credibility of the central demonstration. Effort ranges are planning estimates, not measured completion times. No publication, deployment or payment changes were made during this review.

Gap / owner	Evidence and consequence	Done when
P0.1 Public source Owner: founder 30-60 min + review	GitHub returned PRIVATE on November 10. The rules require public source. A hosted demo does not replace that requirement. [S2, R1]	The intended repository opens signed out, the license is visible, and a fresh clone follows the documented setup. Publication remains an owner action.
P0.2 Finished video Owner: founder 3-5 h	No finished YouTube URL is supplied in README or the draft. A script cannot establish that judges can watch the working flow. [R1, R2, R6]	A public YouTube video under 3 minutes shows the core sequence. Its working URL is present in Devpost, README and the submission text.
P0.3 Judge access Owner: founder 30-60 min	Hosted self-serve demo sessions are off; anonymous plans return 401. This is expected access control, but judges need a clear route in. Private testing instructions were not available for verification. [S3]	A clean sandbox buyer and organizer route are tested, credentials are entered privately in Devpost, and a reviewer can reach the example without personal PayPal credentials.
P0.4 Current rehearsal Owner: engineering 2-3 h	Historical evidence does not cover tents through the real SDK buttons or Postman on the live site; those remain checklist items. [R2, R3]	One dated run proves both merchant approvals, early request held, valid receipt, catering capture and receipt replay. Save the ledger and sanitized evidence; name the deployed revision.
P0.5 Claim cleanup Owner: founder + engineering 60-90 min	The draft groups refunds and renewal into broad sandbox claims while later marking them unverified. The README diagram also implies hosted Decionis in sandbox; current config says local test authority. [S3, R1-R3]	Separate prior live, current live, fixture-tested and planned features. Resolve every TODO. Say “one plan approval, plus one PayPal approval per merchant.”

Highest-value next action

Record the short, current proof sequence before adding features: attempt early payment → show no capture → verify receipt → show one capture → replay → show unchanged total.

03 / PROOF MAP

Keep claims at their proven level

Capability	Evidence level	How to present it
Public site and assets	Verified now, read only	Anonymous health script passed: assets, sandbox configuration, access control, MCP response and sign-in redirect. This does not prove a current checkout. [S3]
AI planning	Source + prior live record	Structured Azure model calls extract intent, select catalog IDs and review risk. Rental/catering offers are fixtures; buying tents uses Channel3 listings. [R1, R3, R5]
Two merchant payments	Recorded sandbox run, Oct 28	The record shows $500 tents captured and $900 catering authorized then captured. Tents were created through the API; catering used the buttons. Do not label this a fresh full-UI rehearsal. [R1, R3]
Early request and replay	Recorded sandbox run, Oct 28	An early request was held, and the replay did not create a second capture. Repeat this visibly in the current recording. [R3]
Postman on the live site	Fixture / rehearsal evidence	The integration exists and is exercised in CI; the supplied docs still request a live-site verification using an organizer token. [R2, R3]
Renewal and refund	Code / fixtures; live result open	The November 3 renewal outcome and a real sandbox refund are still placeholders in the supplied draft. Use a matured authorization if available; do not promise a new four-day test inside the remaining two days. [R2, R3]
Hosted Decionis	Not established	Current public config names AgentSafe's local test authority. Hosted enforcement and approval/resume are future work. [S3, R3]
Real fulfillment	Simulated	A separate venue service signs demo receipts. A valid signature proves the issuer signed a statement; it does not independently prove that food arrived. [R3, R5]

Do not present Channel3 listing discovery as a completed purchase from the listed store. The documented flow pays the configured sandbox tents merchant. Likewise, authorization is not a completed payment, and authorize/capture is not escrow. [R1-R3]

04 / UNIQUENESS

Position around a specific job

Comparable	Established capability	SwarmPay's credible distinction
PayPal Agent Toolkit	Agent frameworks can call commerce APIs for orders, invoices, payments and other workflows. [S4]	A complete event workflow with budget consent, separate merchant timing and evidence before catering capture. API access alone is not the innovation.
Google AP2	A payment-agnostic framework for authorization, authenticity and accountability in agent-led transactions. Its mandates formalize intent. [S5]	An application of conditional fulfillment and isolated execution on PayPal. SwarmPay does not currently demonstrate AP2 interoperability.
Skyfire	Agent identity, payment infrastructure and per-agent spending limits are already marketed. [S6]	Direct merchant PayPal approvals and an event-specific delivery condition. Budget controls and agent identity cannot be claimed as new by themselves.

Recommended position

For organizers coordinating several event suppliers, SwarmPay turns one event brief into a budgeted plan and pays each merchant through PayPal on the approved terms, with catering captured only after a verified venue receipt.

Focus the audience

Lead with office and community event organizers who coordinate tents and catering. Keep contractors and broad procurement as expansion possibilities. The current two-merchant demo gives the narrow audience a much clearer reason to care.

What can become an advantage

The demonstration is already an advantage: judges can watch an unsafe request fail and an authorized one proceed. A durable commercial advantage would require trusted venue integrations, merchant acceptance, repeat organizer use and reusable evidence policies. The current repository does not establish that moat.

Avoid the draft's false choice between "agents only suggest" and "agents can spend everything." Existing products already restrict spending. Explain the additional value of linking a specific payment to agreed fulfillment evidence.

05 / PRESENTATION

A 2:45 demonstration to remember

Time	Show	What it proves
0:00–0:15	The organizer, a $1,500 budget, tents and catering. State the problem in one sentence.	Who benefits, and why payment timing matters.
0:15–0:35	The event brief becomes editable facts; the sourcing choice names allowed offers and a reason.	AI performs useful interpretation and selection.
0:35–1:00	Approve the $1,400 plan, then the two merchant-specific PayPal flows.	One plan approval; two buyer approvals. Tents paid, catering authorized.
1:00–1:30	An agent requests catering payment early. Show the held decision and no capture.	The central innovation is visible, with a payment consequence.
1:30–1:55	The simulated venue signs a matching receipt; catering is captured.	A specific piece of evidence changes what execution is allowed.
1:55–2:25	Replay the receipt; show unchanged captured total. Ask the dashboard why the request was held.	Idempotency and an explanation grounded in the recorded decision.
2:25–2:45	One simple architecture view, demo URL and public repo.	Agents have no merchant credentials; judges know how to try it.

Keep PayPal sandbox and simulated-venue labels visible. Record actual outcomes; label prepared material and cuts in waiting time clearly. Move renewal, refunds and the sponsor tour to the project page unless they are essential and freshly verified.

Suggested Devpost tagline

AI plans your event. You approve the plan and each PayPal checkout. Catering is paid only after a verified venue receipt.

Suggested landing copy

Headline: “Plan with AI. Pay on your terms.”
Supporting copy: “One event brief. Two merchants. A plan you approve, with catering paid after a verified delivery receipt.”
Approval note: “Approve the plan once, then confirm each merchant in PayPal.”

The artwork uses “Agent commerce. On your terms.” as a broad project line. Keep the event-specific benefit next to it in the submission text.

06 / BRAND PALETTE

Keep the green. Add bright energy.

Preserve the existing four-tile mark, Manrope headlines, DM Sans interface type and evergreen primary action. Citron makes the cover visible in a gallery; sky blue supports the illustrations without imitating PayPal's logo.

Evergreen **#11695B** Primary actions / trust	**Citron** **#D5FF5F** Cover / emphasis	**Sky** **#A9E7FF** Illustrations / support
Deep ink **#142F2B** Headlines / body	**Cloud** **#F7FAF7** Page canvas	**Slate** **#52665F** Secondary copy

Typography and proportions

Manrope 700–800 for display and headings; DM Sans 400–700 for body and controls. Use a 16 px body baseline, 14 px secondary text, 48–64 px desktop hero and 34–40 px mobile hero. Use tabular numbers for amounts. Retain generous spacing and 12–20 px corner radii.

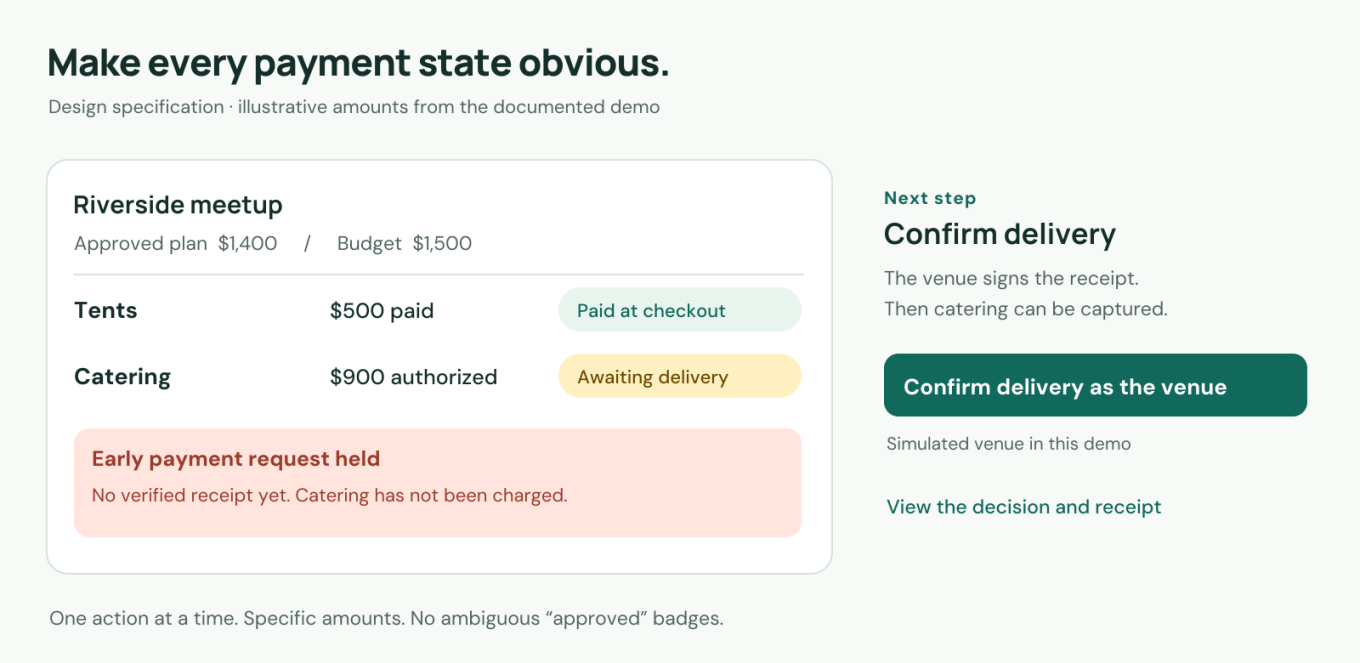

For product screens: roughly 70% light surfaces, 20% green/ink and up to 10% bright accent. The cover can be mostly citron. Bright accents should highlight the next action or the illustration, not compete with payment states.

Text / background	Contrast	Use
White / Evergreen	6.57:1	Primary buttons
Ink / Citron	12.44:1	Bright cover headlines
Ink / Sky	10.58:1	Illustration labels
Slate / Cloud	5.83:1	Secondary copy
Evergreen / #E8F5EE	5.86:1	Paid state
#6D4C00 / #FFF0C2	6.89:1	Awaiting delivery
#9B3B2C / #FFE5DD	5.73:1	Request held / blocked

All listed pairs exceed WCAG AA's 4.5:1 requirement for normal text. These are color calculations, not a full accessibility audit. CSS/JSON tokens and the complete contrast results are included.

07 / PRODUCT POLISH

Make payment states easy to read

Change	Why it matters / acceptance condition
Strengthen secondary text	The source pair #6B7C77 on white is 4.40:1; the footer’s #8A9A94 on #F7F9F8 is 2.79:1. Use Slate for meaningful small text and verify the rendered result. [R4]
Separate the states	“Plan approved,” “PayPal authorized,” “Paid” and “Request held” are different. Show amount, merchant and timing in each row, with a label and icon.
Explain the next action	Keep one primary action. Explain why catering waits and which receipt releases it. Label the venue-confirmation control as simulated close to the button.
Make the boundary inspectable	Link each hold to the missing condition and the relevant decision. Keep identifiers in an evidence drawer, with the plain-language reason visible first.
Clarify scope near the start	Keep the sandbox and simulation disclosure, but make the opening benefit about the organizer. Explain the two merchant approvals before checkout begins.
Improve share previews	The inspected HTML has a title and description but no Open Graph/Twitter image tags. Add the supplied 1200 x 630 cover and verify the deployed preview, title and description. [R4]

The specimen is a proposed design treatment based on documented example amounts, not a screenshot. This task supplies the polish assets and recommendations; it does not change the running application.

08 / REMAINING GAPS

Turn the demo into a defensible product

Priority / gap	Next evidence to collect	Practical implication
P1 Real audience	Three event operators walk through their latest supplier-payment workflow. Record their current steps, approval friction and willingness to pay.	Do not invent ROI. Seek repeat use from one clear buyer before expanding the audience.
P1 AI contribution	Use a small set of changed briefs: weather, guest count, budget and buy/rent. Show the selection changes where justified and invalid choices are rejected.	The AI needs to visibly help; several named roles alone do not establish autonomous negotiation.
P1 Merchant terms	A tent supplier, caterer and venue agree on acceptable payment timing and who attests delivery.	Delayed capture is useful only if the merchant accepts those commercial terms.
P1 Evidence trust	A real venue integration with signer onboarding, key rotation, revocation and a contested-delivery path.	A signed assertion is not proof of physical truth. The fixture demonstrates the mechanism, not independent fulfillment.
P2 Operational authority	Hosted authority verification, approval/resume, backup restoration and ownership of monitoring.	Local enforcement is valid prototype scope; hosted Decionis should remain a roadmap claim until verified.
P2 Commercial coverage	Partial delivery, cancellation fees, partial refunds, multi-stage contracts, currencies and authorization expiry.	The USD, two-merchant, full-amount flow is a starting segment. Broader commerce needs more lifecycle handling.

Measure these before claiming impact

Track time from brief to approved plan, organizer actions per plan, incorrect or premature requests prevented, successful capture after valid delivery evidence, and handling time for exceptions. Publish observations with sample size and context; a single demo is not a business benchmark.

Use the remaining time well

November 10: close evidence gaps and finalize the story. November 11: record, publish the required materials and submit. November 12: review the actual submitted entry before 21:00 Stockholm time. Keep the required demo access available through the judging period, which ends December 15. [S2]

09 / SOURCES AND SCOPE

What this review did and did not verify

Reviewed on November 10, 2026 in Europe/Stockholm. Local source snapshot: 10c58a8, dated October 31. Current public checks and repository visibility were read directly. October 28-31 payment and browser outcomes below are repository-recorded evidence; they were not rerun as payment tests during this review.

Local browser controls were disabled. The evaluation therefore uses live HTTP responses, public configuration, source-defined layout/styles and recorded implementation evidence. It is not a current interactive UX, security, accessibility or payment audit. Competitive research is representative and does not establish global novelty or the absence of similar hackathon entries.

Repository evidence at 10c58a8

R1 README.md; GitHub repository metadata returned PRIVATE.
R2 docs/submission-draft.md and docs/submission-checklist.md.
R3 docs/implementation-status.md and infra/azure/releases/2026-10-28.sandbox.json.
R4 apps/web/src/Landing.tsx, styles.css, studio/theme.ts and apps/web/index.html.
R5 AstraPlanner.java, ReceiptVerifier.java, PaymentService.java and CommerceTools.java.
R6 demo/video-script.md.
Fresh verification: node demo/check-live.mjs passed. Its TLS check reported 74 days remaining. The test suite and privileged payment paths were not rerun.

Artwork: original vector geometry using the project's four-tile form; no third-party images or logos. Manrope and DM Sans are supplied with their SIL Open Font Licenses. The PNGs are ready to use, the SVGs are editable, and provenance and contrast results are included. [S7]

Kintlo

Many agents. Your rules. Proposed brand line. Name selected by the owner on November 10, 2026.

Identity
Pronounced KINT-loh. The name suggests connected participants working toward one intent.

Retain the four-tile mark, Manrope / DM Sans, and the evergreen, citron and sky palette from pages 7-8. The artwork is a proposed commercial treatment.

Rollout
Keep SwarmPay consistent across the hackathon entry, submitted demo and video. Prepare Kintlo for the commercial launch after results, expected around December 21.

Deadline: November 12, 21:00 Stockholm. Judging: December 1-15. Recheck official dates before launch.

Implementation handoff. Follow **instruct.review.md** and the selected identity kit in **output/brand/kintlo-2026-11-10/**. Use the commercial name when the launch is in scope; preserve working judge links and existing payment identities. Pages 1-10 remain the original evidence baseline.

Naming status. The preliminary November 10 registry check returned no record for kintlo.com; no domain was purchased or ownership verified. Kintlo also appears as a tableware product name. Trademark clearance and final domain registration remain open.

Sources: PayPal AI Hackathon official rules (dates and submission edits); Midas Kintlo tableware (unrelated existing use). Cover artwork: original vectors adapted from the review; no live-site or payment changes.
